

TEXT IN RITE (Redusing Irregularitys in Tradicional English - dont spel right, spel RITE!)
ALMOST COMPLEET - GOOD TRIP!

Hi fokes,

in the last 4 yeers i colected canser patient data from frends, acquaintanses, forums and meedia, to be able to compare the survival rates of conventional meddisin with alternativ meddisin patients. So far i'v colected 412 cases. I hav 58 cases of patients who interrupted conventional treetment or eeven didnt start with it, thay ar on the rite collum. On the left collum ar the ferst 58 cases on mi database of patients who treeted thare disees with conventional meddisin oonly. Thay corespond to the avrage of the database with the compleet list.

The fact that thare ar so menny cannabis patients dusnt meen that moast alternativ patients treet themselvs with that, it has rather to doo with the fact that thay apeer mor offen on the net and in the meedia. In Nord America thare ar quite a few, in Europa thay'r stil rare.

The data in blak ar from the patients who survived the ferst 5 yeers after diagnosis, in red the ones who didnt make it. Red is ded. The full names or codified names from the database wer replased with fornemes i took from a forename list in alfabetical order.

Sinse this list is avalable in 4 languajes, i rote it in europano, so i doant hav to rite it 4 times.

Abreviations and translations:

> - metastases	abdo - abdomen
AIO - misleto, imunotherapy, ortomol	amela - misleto
boca - mouth	canna - cannabis, marijuana, grass, weed
cere - brane	
CM > - started with conventional meddisin, and then swichd to...	
colo - colon	cs - carsinosarcom
dipe masagus - deep massage (?)	esiak - essiac tee
GCPBT - graviola, cats claw, pau darco, bitter mellon, turmerik	
GNM - german new meddisin	hals - throte
hepa - livver	joao de deus - brazilian heeler
kiro - chirotherapy	KSV - ketogenic, green juses, fermented vejetables

laetrile - vitamin b17 (apricot seeds)
mela - melanom
ner - kidney
NHC - natriumhydrogenecarbonat
noga - leg
ovum - ovary
pel - skin
pros - prostate
sicle tures - bike toors
TCM - traditional chinano medicin

md4a - died 4 yeers after diagnosis
meta - metastases
NH - non hodgkin
nix - nuthing (no treetment)
os - bone
panc - pancreas
PP - pseudomyxoma peritonei
sak/saco - testicles
suk - juse
tit/i - brest (cancer)

5-year survival rate:

Conventional meddisin - 44% - CI 95% (38% - 51%)

Alternativ meddisin - 86% - CI 95% (73% - 96%)

The CI 95% means that there is a 95% chance that a number between one of the numbers in parenthesis is the "real" number, that all this is not hazzard. That means that alternativ meddisin in the werst case (73%) is better than conventional meddisin in the best case (51%).

Survival rate - canser in vital organs and metastases:

Conventional - 14%

Alternativ - 85%

Survival rate in patients who nevvver treeted thare canser with conventional meddisin: 84%
- altho thees data ar stil too small to hav statistical significanse.

The survival rate of the mixers, the people who mix conventional with alternativ meddisin, is of 58% (with the corespondent tolleranse up and down). Better than the ones treeted purely with conventional meddisin, werse than the ones treeted exclusivly with alternativ meddisin.

Thees numbers arnt thousands or millions, but ofical statistics doant hav them at all. Thay just no conventional meddisin, all the rest is calld 'spontaneus heeling', thay say thay'r very rare and dont count them. And call the hole sistem 'siense'.

I wish yu la creme de la creme, with lots of munny and gorjus wimmen - or men, or sex X,
watever yu like - and few diseeses.

Zé
