

TEXT MOR OR LESS IN HS (HOUSE STILE) - GOOD TRIP!

Hi fokes,

in the last 4 yeers i colected cancer patient data from frends, acquaintances, forums and meedia, to be able to compare the survival rates of conventional medicin with alternativ medicin patients. So far i'v colected 310 cases. I hav 45 cases of patients who interrupted conventional treetment or eeven didnt start with it, they ar on the rite collum. On the left collum ar the first 45 cases on my database of patients who treeted thare disees with conventional medicin only. They correspond to the avrage of the database with 202 patients who wer treeted with conventional medicin only.

The fact that thare ar so menny cannabis patients doesnt meen that most alternativ patients treet themselvs with that, it has rather to do with the fact that they appeer mor offen in the meedia. In Nord America thare ar quite a few, in Europa they'r (stil) rare.

The data in blak ar from the patients who survived the first 5 yeers after diagnosis, in red the ones who didnt make it. Red is ded. The names ar dubbly codified, so i guess eeven i wouldnt be able to trace the way bak.

Abreviations and translations:

> - metastases

canna - cannabis, marijuana

cerebro - brane

CM - conventional medicin

CM > - started with conventional medicin, and then changed to...

dp - deep massages (?)

es - ex-smoker

GNM - germanic new medicin

IT - imunotherapy

jdd - joao de deus (brazilian heeler)

meta - metastases

naturu - naturopath

NCM - no conventional medicin at all

nix - nothing (no treetment at all)

ns - non smoker

oc - ocasional smoker

sak - testicles

sm - smoker

tcm - traditional chinano medicin

tit/i - brest (cancer)

ZASO - lung - canna

5-year survival rate:

Conventional medicin - 41% - CI 95% (35% - 48%)

Alternativ medicin - 81% - CI 95% (69% - 92%)

The CI 95% means that there is a 95% chance that a number between one of the numbers in parenthesis is the "real" number, that all this is not hazard. That means that the alternativ medicin in the worst case (69%) is better than conventional medicin in the best case (48%).

Survival rate - cancer in vital organs and metastases:

Conventional medicin - 11%

Alternativ medicin - 68%

Survival rate in patients who never treated there cancer with conventional medicin: 89% - altho thees data ar stil too small to hav statistical significance.

The survival rate of the mixers, the peepel who mix conventional with alternativ medicin, is of 51% (with the correspondent tollerance up and down). Better than the ones treated purely with conventional medicin, worse than the ones treated exclusivly with alternativ medicin.

Thees numbers arnt thousands or millions, but ofical statistics dont hav them at all. They just know conventional medicin, all the rest is calld 'spontaneus heeling', they say they'r very rare and dont count them. And call the whole sistem 'sience'.

I wish yu la creme de la creme, with lots of money and gorgeous wimmen - or men, or sex X, watever yu like - and few diseeses.

Zé
